WHAT'S NEW IN SYHUNT 7.2

Syhunt Hybrid 7.2 introduces Authenticator 2.0 and major platform enhancements

June 1, 2026

Syhunt is proud to announce the release of Syhunt Hybrid 7.2. This release marks a major milestone for Syhunt Hybrid, delivering significant advancements across authenticated scanning, web-based operations, scan management, and cross-platform support. A centerpiece of this release is the introduction of **Syhunt Authenticator 2.0**, a complete redesign of the authentication framework that simplifies configuration while expanding support for modern authentication scenarios, including login sequence recording. Building on the foundation established by previous releases, the update further modernizes the platform, improves visibility into ongoing assessments, and expands testing capabilities for today's increasingly complex applications.

"This is not only the next major update following last year's September release, which introduced API scanning capabilities, but likely one of the most important releases in Syhunt's last decade," said Felipe Daragon, Chief Visionary Officer (CVO) of Syhunt. "The amount of work invested in modernizing the platform, redesigning authentication testing, improving usability, and unifying functionality across Windows, Linux, and macOS makes this a transformative release for both existing and new customers."

Authenticator 2.0

Version 7.2 introduces Syhunt Authenticator 2.0, a complete redesign of Syhunt Dynamic's authentication framework. All authentication methods are now managed through a unified module and configuration interface, simplifying setup and maintenance. New authentication methods include **Recorder** (that replays a login sequence previously recorded using Edge, Chrome, or another Chromium-based browser), **Manual** (through the new Syhunt Sandcat browser extension), Smart, **Selenium-Auto**, and **Selenium-JS**, while the legacy Selenium-Python authentication has been retired. The result is a more streamlined, secure, and capable authentication experience fully integrated into the scanning workflow. **Read more**

OWASP Top 10 2025 & CWE Top 25 2025 Coverage, and more

The release also updates security coverage to align with OWASP Top 10 2025 and CWE Top 25 2025, migrates all CLI applications to Rust, removes legacy dependencies, and completes the transition to a modern web-based platform—further reinforcing its position as one of the most significant milestones in Syhunt's recent history.

Highlights of Version 7.2

- Updated detection coverage to align with OWASP Top 10 2025 and CWE Top 25 2025.
- Introduced Authenticator 2.0 with unified authentication management.
- Added Recorder, Smart, Selenium-Auto, and Selenium-JS authentication methods.
- Simplified HTTPS deployment for the web interface on Windows and Linux.
- Added Syhunt Sandcat browser extension for manual login and browser-assisted operations.
- Enhanced scan monitoring with real-time progress updates and active scan visibility.
- Added scan comparison capabilities within the web interface.
- Expanded support for scanning compressed archives (.zip, .7z, .tar) and Android apps (.apk).
- Improved authenticated scanning, session handling, and re-login mechanisms.
- Expanded AJAX crawling support across Windows, Linux, and macOS.
- Improved crawling with adaptive depth and restraint mechanisms.
- Enhanced support for private Git repositories through the web interface.
- Added integration improvements for issue trackers and vulnerability management workflows.
- Migrated all CLI applications to Rust.

- Simplified installation by removing external dependencies and consolidating components into the installer.
- Retired the classic desktop interface in favor of the modern web-based platform.

That's all, for now. Happy bug hunting!
